

For this last sprint, we actually did not have too many features to implement. In Sprint 3, we were able to get most of the core functionality finished in time for the in-class demo. This included the friends list and verification process. Consequently, this left Sprint 4's main tasks to be Assignment 2-related tasks and UI refinement. This is why we didn't assign too many tickets in our JIRA backlog.

In terms of our scheduler, we only had 3 main paths, which were all critical. Out of the three paths, the middle path (Assignment 2), is the most important at this point which is why we have multiple people working on it. As of now, we are making good progress and we should be able to complete Assignment 2 before the deadline. As for the other paths, the friend related path is almost complete and should be finished before the final day of the project. Finally, the bottom path is finished, as all major UI refinements are already implemented within the sprint-4 branch. Overall, this sprint has been a pretty quiet, yet productive sprint.
